- PTA:** Predicted Transmitting Ability PTA is the predicted difference between a parent animal's offspring and the average, due to the genes transmitted from the parent. Each PTA is given in the units used to measure the trait. The PTA for milk is reported in pounds, the PTA for productive life is reported in months.
- PTAM:** Predicted Transmitting Ability Milk production in pounds, reflecting the expected milk production of future mature daughters.
- PTAF:** Predicted Transmitting Ability Fat pounds, reflecting the expected butterfat production of mature daughters
- PTAF%:** Predicted Transmitting Ability Fat %, indicates the bull's genetic variance for transmitting fat and being positive or negative.
- PTAP:** Predicted Transmitting Ability Protein production in pounds reflecting the expected protein production of mature daughters.
- PTAP%:** Predicted Transmitting Ability Protein %, indicates the bull's genetic variance for transmitting protein and being positive or negative.
- PL:** Productive Life, gives a measure of the number of productive months, lifetime you can expect from a bull's daughters
- LIV:** Cow Liveability, measure of a cow's ability to remain alive while in the milking herd.

- SCS:** Somatic Cell Score, is used to improve mastitis resistance. Bulls with low a PTA for SCS (less than 3.00) are expected to have daughters with lower mastitis than bulls with high PTA for SCS (greater than 3.50)
- DPR:** Daughter Pregnancy Rate, is defined as the percentage of cows that become pregnant during each 21 day period. A DPR of '1.0' implies that daughters from this bull are 1% more likely to become pregnant during that estrus cycle than a bull with an evaluation of zero. Each increase of 1% in PTA DPR equals a decrease of 4 days in PTA days open
- HCR:** Heifer Conception Rate, a virgin heifers ability to conceive. Defined as a percentage of inseminated heifers that become pregnant each service. A HCR of 1.0 implies that daughters of this bull are 1% more likely to become pregnant as a heifer than daughters of a bull with an evaluation of 0.0
- CCR:** Cow Conception Rate, a lactating cows ability to conceive. Defined as a percentage of inseminated cows that become pregnant each service. A HCR of 1.0 implies that daughters of this bull are 1% more likely to become pregnant as a cow than daughters of a bull with an evaluation of 0.0.
- BCS:** Body Condition Score, reflects the animal's energy balance status in which research has clearly shown an association with improved female fertility, longevity and disease resistance.
- SCE:** Sire Calving Ease, the percentage of calving difficulties in first lactation animals. The average percentage difficult births is approximately 2.2%. in general, bulls with a SCE of 2.2% or less are considered "calving ease" bulls that are fine to use on heifers and smaller cows.
- DCE:** Daughter Calving Ease, like SCE, DCE is a measurement of the tendency of calves from a particular animal to be born easy (average 2.3%). Daughters of bulls with high DCE numbers would be expected to have a more difficult time giving birt than daughters of bulls with lower DCE numbers. DCE is evaluated on the same scale as SCE.
- SSB:** Sire Stillbirth, the percentage of a bull's offspring that are born dead to first lactation animals.
- DSB:** Daughter Stillbirth, is expressed as a percent stillbirth, where stillborn calves are those scored as dead at birth or born alive but died within 48 hours of birth. The average is 5.3%
- FE:** Feed Efficiency, is the net profit a farmer receives from an increase in production  $FE = (\$0.0008 \times PTAM) + (\$1.55 \times PTAF) + (\$1.73 \times PTAP) + (\$0.11 \times \text{Feed Saved})$
- FI:** Fertility Index, combines several reproductive components ( DPR, CCR, HCR and Early First Calving) in to one overall index.  $FI = (0.7 \times DPR) + (0.1 \times HCR) + (0.1 \times CCR) + (0.1 \times EFC)$
- PTAT:** Predicted Transmitting Ability for Type, is an estimate of the genetic superiority for conformation that bull will transmit to its offspring. This is directly correlated with the final score of the bull's daughters, not the linear traits.
- UDC:** Udder Composite Index, is an index based on ability for udder improvement. Udder composite includes six linear traits and the weighting for each trait's contribution to higher udder scores.
- FLC:** Foot and Leg Composite Index, is a measure of a bull's ability for foot and leg improvement.

# Ecofeed®

The largest evidence-based Feed Conversion Efficiency index in the world

The EcoFeed® program utilizes a measure of feed conversion efficiency known as residual feed intake (RFI). RFI is a measure that quantifies the variation in feed intake beyond that needed to support maintenance and performance requirements. RFI can be used in multi trait selection indexes to simultaneously improve both feed conversion efficiency and other economically relevant traits, as it is independent of body size and production. This makes RFI an ideal trait for the EcoFeed® index as we strive to create a future in which dairy cattle produce more outputs with fewer inputs, providing farmers with the economic and environmental sustainability necessary for long term success.
